O que é um blockchain? É uma tecnologia que permite a criação de blocos de dados que são armazenados em uma rede descentralizada. Cada bloco contém informações sobre transações e é ligado ao bloco anterior por um código criptográfico. Isso garante a segurança e a integridade dos dados.

Existem quatro tipos principais de redes blockchain:

- Blockchain pública: qualquer pessoa pode participar e transacionar.
- Blockchain privada: apenas membros autorizados podem participar.
- Blockchain híbrida: combina características de redes públicas e privadas.
- Blockchain permissionada: apenas membros autorizados podem participar, mas a rede é descentralizada.

Embora a tecnologia blockchain seja promissora, ainda existem desafios a serem superados, como a escalabilidade e a interoperabilidade entre diferentes redes.
